

ON FUZZY β -COMPACT SPACES AND FUZZY β -EXTREMALLY DISCONNECTED SPACES

GANESAN BALASUBRAMANIAN

The concept of fuzzy β -open set is introduced. Using fuzzy β -open sets the concepts of fuzzy β -compact spaces and fuzzy β -extremally disconnected spaces are introduced and some interesting properties of these spaces are investigated.

1. INTRODUCTION

Pre open sets were introduced by Mashour [5]. And using fuzzy sets the above concept is introduced and studied in fuzzy setting by Bin Shahna [4]. The concept of β -open sets was introduced in [1] and studied also by Allam and El Hakeim [2]. In this paper we introduce and study this concept in fuzzy setting.

2. PRELIMINARIES

A fuzzy set λ in a fuzzy topological space X is called fuzzy semi open [4] if for some fuzzy open set ν we have $\nu \leq \lambda \leq \text{cl}(\nu)$ and the complement of a fuzzy semiopen set is called a fuzzy semiclosed set in X . A fuzzy set λ is called preopen if $\lambda \leq \text{Int cl } \lambda$ and the complement of a fuzzy preopen set is called fuzzy preclosed set. A fuzzy set λ is called fuzzy α -open [4] if $\lambda \leq \text{Int cl Int } \lambda$.

A fuzzy topological space X is product related [4] to a fuzzy topological space Y if for any fuzzy set ν in X and \mathcal{C} in Y whenever $\lambda' (= 1 - \lambda) \not\leq \nu$ and $\mu' (= 1 - \mu) \not\leq \mathcal{C}$ imply $\lambda' \times 1 \vee 1 \times \mu' \geq \nu \times \mathcal{C}$, where λ is a fuzzy open set in X and μ is a fuzzy open set in Y , there exist a fuzzy open set λ_1 in X and a fuzzy open set μ_1 in Y such that

$$\lambda'_1 \geq \nu \quad \text{or} \quad \mu'_1 \geq \mathcal{C} \quad \text{and} \quad \lambda'_1 \times 1 \vee 1 \times \mu'_1 = \lambda' \times 1 \vee 1 \times \mu'.$$

For two mappings $f_1 : X_1 \rightarrow Y_1$ and $f_2 : X_2 \rightarrow Y_2$, we define the product $f_1 \times f_2$ of f_1 and f_2 to be a mapping from $X_1 \times X_2$ to $Y_1 \times Y_2$ sending (x_1, x_2) in $X_1 \times X_2$ to $(f_1(x_1), f_2(x_2))$.

A function f from a fuzzy topological space X to a fuzzy topological space Y is said to be fuzzy β -continuous if the inverse image of each fuzzy open set in Y is fuzzy β -open in X . f is said to be M - β -fuzzy continuous if the inverse image of

each fuzzy β -open set in Y is fuzzy β -open in X . Also f is called M - β -fuzzy open if the image of each fuzzy β -open set in X is fuzzy β -open in Y . f is called fuzzy precontinuous [4] if $f^{-1}(\lambda)$ is fuzzy preopen set in X whenever λ is a fuzzy open set in Y .

3. FUZZY β -OPEN SETS

Definition. Let X be a fuzzy topological space. A fuzzy set λ of X is called fuzzy β -open if $\lambda \leq \text{cl Int cl}(\lambda)$. The complement of a fuzzy β -open set is called fuzzy β -closed.

The family of all fuzzy β -open sets of X is denoted by $F\beta 0(X)$. The fuzzy β -closure of λ will be denoted by $F\beta - \text{cl}(\lambda)$.

The following are the properties of fuzzy β -open sets and fuzzy β -continuous maps.

1. Arbitrary union of fuzzy β -open sets is a fuzzy β -open set.

Proof. Follows from

$$(\forall \lambda_i) \leq \vee \text{cl Int cl}(\lambda_i) \leq \text{cl Int cl}(\vee \lambda_i). \quad \square$$

2. Arbitrary intersection of fuzzy β -closed sets is fuzzy β -closed.
3. The implications contained in the following diagram are true.

The following example [2] shows that the reverse need not be true.

Example. Let $I = [0, 1]$ and define fuzzy sets on I as

$$\begin{aligned}
 \mu_1(x) &= \begin{cases} 0 & 0 \leq x \leq \frac{1}{2} \\ 2x - 1 & \frac{1}{2} \leq x \leq 1 \end{cases} \\
 \mu_2(x) &= \begin{cases} 1 & 0 \leq x \leq \frac{1}{4} \\ 2 - 4x & \frac{1}{4} \leq x \leq \frac{1}{2} \\ 0 & \frac{1}{2} \leq x \leq 1 \end{cases} \\
 &= \begin{cases} 0 & 0 \leq x \leq \frac{1}{4} \\ \frac{1}{3}(4x - 1) & \frac{1}{4} \leq x \leq 1. \end{cases}
 \end{aligned}$$

Put $\tau = \{0, \mu_3, 1\}$; $\sigma = \{0, \mu_1, \mu_2, \mu_1 \vee \mu_2, 1\}$. Then μ_1 in (I, τ) is fuzzy preopen but not fuzzy open and μ_3 in (I, σ) is not fuzzy preopen but it is fuzzy β -open.

4. Suppose λ is fuzzy β -open in X and μ is fuzzy β -open in Y . Then $\lambda \times \mu$ is fuzzy β -open in $X \times Y$ if X is product related to Y [4].
5. Let μ be a fuzzy set in X and λ is a fuzzy preopen set such that $\lambda \leq \mu \leq \text{cl Int } \lambda$. Then μ is a fuzzy β -open set.

Proof. Since λ is a fuzzy preopen set we have $\lambda \leq \text{Int cl}(\lambda)$. Then

$$\mu \leq \text{cl Int } \lambda \leq \text{cl Int} [\text{Int cl } \lambda] = \text{cl Int cl } \lambda \leq \text{cl Int cl}(\mu). \quad \square$$

6. Let X_1, X_2, Y_1 and Y_2 be fuzzy topological spaces such that X_1 is product related to X_2 and $f_1 : X_1 \rightarrow Y_1, f_2 : X_2 \rightarrow Y_2$ be mappings. If f_1 and f_2 are fuzzy β -continuous, then so is $f_1 \times f_2$.

Proof. Let $\lambda = \bigvee_{i,j} (\lambda_i \times \mu_j)$ where λ_i and μ_j are fuzzy open sets in Y_1 and Y_2 respectively, be a fuzzy open set in $Y_1 \times Y_2$. Now

$$(f_1 \times f_2)^{-1}(\lambda) = \bigvee (f_1 \times f_2)^{-1}(\lambda_i \times \mu_j) = \bigvee f_1^{-1}(\lambda_i) \times f_2^{-1}(\mu_j).$$

since f_1 and f_2 are fuzzy β -continuous $f_1^{-1}(\lambda_i)$ and $f_2^{-1}(\mu_j)$ are fuzzy β -open. And so $(f_1 \times f_2)^{-1}(\lambda)$ is fuzzy β -open by (1) and (3). That is $f_1 \times f_2$ is fuzzy β -continuous. \square

- 7 Let X, X_1 and X_2 be fuzzy topological spaces and $p_i : X_1 \times X_2 \rightarrow X_i (i = 1, 2)$ be the projection mappings. If $f : X \rightarrow X_1 \times X_2$ is fuzzy β -continuous, then so is $p_i \circ f$.

Proof. This follows because projection maps are fuzzy continuous. \square

8. The implications contained in the following diagram are true:

The following example shows that the reverse need not be true. Define $f : (I, \tau') \rightarrow (I, \sigma)$ by $f(x) = \frac{x}{2}$, where $\tau' = \{0, \mu'_3, 1\}$. Then f is fuzzy precontinuous but not fuzzy continuous.

4. FUZZY β -COMPACT SPACES

Definition 1. A space X is called fuzzy β -compact (Lindelöf) if every fuzzy β -open cover of X has a finite (countable) subcover.

If (X, T) is a fuzzy topological space, then T_β stands for the fuzzy topology on X having $F\beta 0(X, T)$ as a subbase.

Proposition 1. (X, T) is a fuzzy β -compact $\leftrightarrow (X, T_\beta)$ is fuzzy compact.

Proof. If (X, T_β) is fuzzy compact, then (X, T) is fuzzy β -compact since $F\beta 0(X, T) \subset T_\beta$. The converse is a consequence of the famous Alexander's subbase theorem for fuzzy topological spaces. \square

Definition 2. A function $f : (X, T) \rightarrow (Y, S)$ is called ϕ_β -fuzzy continuous (ϕ'_β -continuous) if $f : (X, T_\beta) \rightarrow (Y, S)$ ($f : (X, T_\beta) \rightarrow (Y, S_\beta)$) is fuzzy continuous.

Example 1. T_β -fuzzy open $\not\Rightarrow \beta$ -fuzzy open.

Let $X = \{a, b, c\}$; $T = \{0_X, 1_X, g\}$ where $g : X \rightarrow [0, 1]$ is such that $g(a) = g(b) = 1$; $g(c) = 0$. Let $f : X \rightarrow [0, 1]$ be such that $f(a) = f(b) = 0$; $f(c) = 1$.

Then f is T_β -fuzzy open and f is not β -fuzzy open.

The following proposition follows from the definitions.

Proposition 2. If $f : (X, T) \rightarrow (Y, S)$ is fuzzy β -continuous then f is ϕ_β -fuzzy continuous.

Example 2. The converse of the above proposition is not true. Let

$$X = \{a, b, c\}$$

$$T_1 = \{0_X, 1_X, f\} \text{ where } f : X \rightarrow I \text{ is such that } f(a) = f(b) = 1; f(c) = 0$$

$$T_2 = \{0_X, 1_X, g\} \text{ where } g : X \rightarrow I \text{ is such that } g(a) = g(b) = 0; g(c) = 1.$$

Let $i : (X, T_{1\beta}) \rightarrow (X, T_2)$ be the identity mapping. Then since $T_{1\beta}$ is the discrete fuzzy topology, i is fuzzy continuous; but i is not fuzzy β -continuous since $g \in T_2$, $i^{-1}(g) = g$ and g is not fuzzy β -open in X .

Proposition 3. If $f : (X, T) \rightarrow (Y, S)$ is M - β -fuzzy continuous, then f is ϕ'_β -fuzzy continuous.

Proof. Follows from the definitions of M - β -fuzzy continuity and ϕ'_β -fuzzy continuity. \square

Example 3. The converse of the above proposition is not true. In Example 2, f is ϕ'_β -fuzzy continuous but f is not M - β -fuzzy continuous.

Example 4. ϕ_β -fuzzy continuity $\not\Rightarrow \phi'_\beta$ -continuity. Let $X = \{a, b, c\}$. Define fuzzy topologies T_1 and T_2 on X as follows:

$$T_1 = \{0_X, 1_X, \lambda_1\} \text{ where } \lambda_1 : X \rightarrow [0, 1] \text{ is such that } \lambda_1(b) = \lambda_1(c) = 0; \lambda_1(a) = 1$$

$$T_2 = \{0_X, 1_X, \lambda_2\} \text{ where } \lambda_2 : X \rightarrow [0, 1] \text{ is such that } \lambda_2(a) = \lambda_2(b) = 1; \lambda_2(c) = 0.$$

Let $i : (X, T_{1\beta}) \rightarrow (X, T_2)$ be the identity function. Then i is fuzzy continuous. That is i is ϕ_β -fuzzy continuous. But $i : (X, T_{1\beta}) \rightarrow (X, T_{2\beta})$ is not fuzzy continuous. Since $\lambda_3 : X \rightarrow I$ is such that $\lambda_3(b) = \lambda_3(c) = 1$; $\lambda_3(a) = 0$ belongs to $T_{2\beta}$ but $i^{-1}(\lambda_3) = \lambda_3 \in T_{1\beta}$.

Proposition 4. If $f : (X, T) \rightarrow (Y, S)$ is a ϕ_β -fuzzy continuous surjective function and (X, T) is fuzzy β -compact, then (Y, S) is fuzzy compact.

Proposition 5. For a fuzzy topological space X , the following are equivalent.

- (i) X is fuzzy β -compact
- (ii) For any family of fuzzy β -closed sets $\{\lambda_i\}_{i \in J}$ with the property that $\bigwedge_{j \in F} \lambda_j \neq 0$ for any finite subset F of J , we have $\bigwedge_{i \in J} \lambda_i \neq 0$.

Proposition 6. A fuzzy β -closed subset of a fuzzy β -compact space is fuzzy β -compact.

Proposition 7. If $f : (X, T) \rightarrow (Y, S)$ is M - β -fuzzy continuous and λ is fuzzy β -compact, then $f(\lambda)$ is fuzzy β -compact.

Proof. Let \mathcal{B} be a fuzzy β -open cover of $f(\lambda)$. Then $f(\lambda) \leq \bigvee_{\mu \in \mathcal{B}} \mu$. And

$$\lambda \leq f^{-1}(f(\lambda)) \leq f^{-1}(\bigvee_{\mu \in \mathcal{B}} \mu) = \bigvee_{\mu \in \mathcal{B}} f^{-1}(\mu).$$

As f is M - β -fuzzy continuous $f^{-1}(\mu)$ is fuzzy β -open for all $\mu \in \mathcal{B}$. As λ is fuzzy β -compact $f^{-1}(\bigvee_{\mu \in \mathcal{F}} \mu) \geq \lambda$ where \mathcal{F} is a finite subcollection of \mathcal{B} . Hence $f(\lambda) \leq \bigvee_{\mu \in \mathcal{F}} \mu$. That is $f(\lambda)$ is a fuzzy β -compact. \square

Proposition 8. Let $f : (X, T) \rightarrow (Y, S)$ be an M - β -fuzzy continuous surjective function of a fuzzy β -compact space X onto a space Y . Then Y is fuzzy β -compact.

Proposition 9. Let $f : (X, T) \rightarrow (Y, S)$ be an M - β -open bijective function and Y be a fuzzy β -compact space. Then X is fuzzy β -compact.

Remarks. In view of Proposition 1, Proposition 5 and Proposition 6 (Proposition 7 and Proposition 8) remain valid if fuzzy β -closed (M - β -fuzzy continuous) is replaced by T_β -fuzzy closed (ϕ'_β -fuzzy continuous). Also Proposition 9 remains valid if M - β -fuzzy open is replaced by ϕ'_β -fuzzy open.

Proposition 10. Let X be a fuzzy β -compact space, Y be a fuzzy Hausdorff space [3] and $f : (X, T) \rightarrow (Y, S)$ be a ϕ_β -fuzzy continuous function, then the image of each T_β -fuzzy closed set in X is fuzzy closed in Y .

Proposition 11. Let $U \subset (X, T)$ be such that χ_U is fuzzy α -open. Let λ be a fuzzy β -open in X . Then $\lambda \wedge \chi_U$ is fuzzy β -open in $(U, T/U)$.

Proposition 12. Let $U \subset (X, T)$ be such that χ_U is a fuzzy α -open in (X, T) . Then χ_U is fuzzy β -compact in $(X, T) \Leftrightarrow (U, T/U)$ is fuzzy β -compact.

5. FUZZY β -EXTREMALLY DISCONNECTEDNESS

Definition. Let (X, T) be any fuzzy topological space. X is called fuzzy β -extremally disconnected if the β -closure of a fuzzy β -open set is fuzzy β -open.

The following proposition gives several characterizations of fuzzy β -extremally disconnected spaces.

Proposition 13. For any fuzzy topological space the following are equivalent.

- (a) X is fuzzy β -extremally disconnected.
- (b) For each fuzzy closed set λ , $\beta - \text{Int}(\lambda)$ is fuzzy β -closed.
- (c) For each fuzzy open set λ , we have $\beta - \text{cl}(\lambda) + \beta - \text{cl}(1 - \beta - \text{cl}(\lambda)) = 1$.
- (d) For every pair of fuzzy open sets λ, μ , in X with $\beta - \text{cl}(\lambda) + \mu = 1$, we have $\beta - \text{cl}(\lambda) + \beta - \text{cl}(\mu) = 1$.

Proof. (a) \Rightarrow (b). Let λ be any fuzzy closed set. Now $1 - \beta - \text{Int}(\lambda) = \beta - \text{cl}(1 - \lambda)$. Since λ is fuzzy closed, $1 - \lambda$ is fuzzy open and therefore $1 - \lambda$ is fuzzy β -open. By (a) $\beta - \text{cl}(1 - \lambda)$ is fuzzy β -open. That is $\beta - \text{Int}(\lambda)$ is β -closed.

(b) \Rightarrow (c). Let λ be any fuzzy open set. Then

$$\begin{aligned} \beta - \text{cl}(\lambda) + \beta - \text{cl}(1 - \beta - \text{cl}(\lambda)) &= \beta - \text{cl}(\lambda) + \beta - \text{cl}(\beta - \text{Int}(1 - \lambda)) \\ &= \beta - \text{cl}(\lambda) + \beta - \text{Int}(1 - \lambda) = \beta - \text{cl}(\lambda) + (1 - \beta - \text{cl}(\lambda)) = 1. \end{aligned}$$

(c) \Rightarrow (d). Assume for any fuzzy open set λ , $\beta - \text{cl}(\lambda) + \beta - \text{cl}(1 - \beta - \text{cl}(\lambda)) = 1$. Suppose λ and μ be any two fuzzy open sets such that

$$\beta - \text{cl}(\lambda) + \mu = 1.$$

Then

$$\begin{aligned} \beta - \text{cl}(\lambda) + \mu &= 1 = \beta - \text{cl}(\lambda) + \beta - \text{cl}(1 - \beta - \text{cl}(\lambda)) \\ \Rightarrow \mu &= \beta - \text{cl}(1 - \beta - \text{cl}(\lambda)) = 1 - \beta - \text{cl}(\lambda). \end{aligned} \tag{A}$$

Thus we find $\mu = \beta - \text{cl}(\mu)$. Then from (A) we have $\beta - \text{cl}(\mu) = 1 - \beta - \text{cl}(\lambda)$. That is $1 = \beta - \text{cl}(\lambda) + \beta - \text{cl}(\mu)$.

(d) \Rightarrow (a). Let λ be any fuzzy open set and put $\beta - \text{cl}(\lambda) + \mu = 1$. That is $\mu = 1 - \beta - \text{cl}(\lambda)$. By (d) $\beta - \text{cl}(\mu) + \beta - \text{cl}(\lambda) = 1$. Therefore $\beta - \text{cl}(\lambda)$ is fuzzy β -open in X . That is X is fuzzy β -extremally disconnected.
