

# On Axiomatic Characterization of Information-Theoretic Measure of Type $(\gamma, \delta)$

I. J. TANEJA, H. C. GUPTA

There are two information-theoretic measures (viz., Kullback's relative-information and Kerridge's inaccuracy) associated with a pair of probability distributions of a discrete random variable. These measures have found many applications in Statistics, Economics, Physics etc. Two parameter generalization of these measures has been studied by many authors. A generalized measure of type  $(\gamma, \delta)$  is characterized in this paper by taking a set of axioms. This measure in particular contains relative-information and inaccuracy and their generalized forms as the limiting cases. Cases of bivariate extensions of this generalized measure and relations between them have been also studied.

## 1. INTRODUCTION

Associated with a pair of discrete probability distributions  $P = (p_1, \dots, p_n)$ ,  $p_i \geq 0$ ,  $\sum_{i=1}^n p_i = 1$  and  $Q = (q_1, \dots, q_n)$ ,  $q_i > 0$ ,  $\sum_{i=1}^n q_i \leq 1$  an information-theoretic measure of type  $(\gamma, \delta)$  is given by

$$(1.1) \quad I_{(\gamma, \delta)}^{(\alpha, \beta)}(P; Q) = (2^{\alpha-\beta} - 2^{\gamma-\delta})^{-1} \sum_{i=1}^n (p_i^\alpha q_i^{\beta-\alpha} - p_i^\gamma q_i^{\delta-\gamma}),$$

$\alpha \neq \gamma$  ( $\beta \neq \delta$ ) whenever  $\beta = \delta$  ( $\alpha = \gamma$ ).

The measure (1.1) has been studied by Sharma and Taneja [13] and Sharma and Gupta [11] by generalizing a functional equation considered by Chaundy and McLeod [1] and by Taneja and Gupta [15] by considering a functional equation which is a generalization of the one considered by Daróczy [2].

For  $\gamma = \delta = 1$  (refer Sharma and Autar [9, 10]) the measure (1.1) reduces to

$$(1.2) \quad I^{(\alpha, \beta)}(P; Q) = (2^{\alpha-\beta} - 1)^{-1} \left( \sum_{i=1}^n p_i^\alpha q_i^{\beta-\alpha} - 1 \right), \quad \beta \neq \alpha, \quad \alpha > 0.$$

The measure (1.2) reduces to (i) Kullback's [7] relative-information when  $\beta = 1$  and there is a limiting case  $\alpha \rightarrow 1$ , (ii) Kerridge's [5] inaccuracy when  $\alpha = 1$  and there is a limiting case  $\beta \rightarrow 1$ .

Further when  $Q \equiv P$  and  $\alpha = \gamma = \delta = 1$ , (1.1) reduces to

$$(1.3) \quad I^\beta(P; Q) = H^\beta(P) = (2^{1-\beta} - 1)^{-1} \left( \sum_{i=1}^n p_i^\beta - 1 \right), \quad \beta \neq 1, \quad \beta > 0,$$

which is entropy of type  $\beta$  introduced by Havrda and Charvát [4] and later differently studied by Daróczy [2] and Vajda [16].

In this communication we characterize the measure (1.1) by taking a set of axioms (cf. Havrda and Charvát [4]). We also study bivariate extensions of measure (1.1) and establish relations between them.

## 2. CHARACTERIZATION THEOREM

Recursivity plays a vital role in characterization of information-theoretic measures. It is well known that the most elegant characterization of Shannon's entropy given by Faddeev (refer Feinstein [3]) so as those given earlier by Shannon [8] and Khinchine [6] use the recursive relation

$$(2.1) \quad H(p_1, \dots, p_n) - H(p_1 + p_2, p_3, \dots, p_n) = p_1 H(p_1/p_i, p_2/p_i),$$

where  $p_1 + p_2 = p_i > 0$ .

Certain changes in this property of additive measures lead to non-additive measures. Havrda and Charvát [4] also used a modification of this property by introducing a parameter  $\beta$  as

$$(2.2) \quad H^\beta(p_1, \dots, p_n) - H^\beta(p_1 + p_2, p_3, \dots, p_n) = p_i^\beta H^\beta(p_1/p_i, p_2/p_i), \quad \beta > 0,$$

where  $p_1 + p_2 = p_i > 0$ .

Further, Taneja [14] generalized (2.2) by taking a general continuous function  $f(p_i)$  in place of  $p_i^\beta$  and established that such a change does not lead to new measures and the only measures that arise are those studied by Shannon [8] and Havrda and Charvát [4].

Also an axiomatic characterization of (1.2) which is a measure of a pair of probability distributions has been studied by Sharma and Taneja [13] by considering the recursive relation of type  $(\alpha, \beta)$  given by

$$(2.3) \quad \begin{aligned} I^{(\alpha, \beta)}(p_1, \dots, p_n; q_1, \dots, q_n) - I^{(\alpha, \beta)}(p_1 + p_2, p_3, \dots, p_n; q_1 + q_2, q_3, \dots, q_n) = \\ = p_i^\alpha q_i^{\beta-\alpha} I^{(\alpha, \beta)}(p_1/p_i, p_2/p_i; q_1/q_i, q_2/q_i), \end{aligned}$$

where  $p_1 + p_2 = p_i > 0$ ,  $q_1 + q_2 = q_i > 0$  and  $\alpha, \beta$  are the parameters.

|  
06

Here we consider a much different form of the recursive relation to characterize (1.1) axiomatically. Precisely, for a pair of probability distributions  $P = (p_1, \dots, p_n)$ ,  $p_i \geq 0$ ,  $\sum_{i=1}^n p_i = 1$  and  $Q = (q_1, \dots, q_n)$ ,  $q_i > 0$ ,  $\sum_{i=1}^n q_i \leq 1$  we consider the following axioms:

- (a)  $I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_n; q_1, \dots, q_n)$  is a continuous function of its arguments;
- (b)  $I_{(\gamma,\delta)}^{(\alpha,\beta)}(1, 0; \frac{1}{2}, \frac{1}{2}) = 1$ ;  $I_{(\gamma,\delta)}^{(\alpha,\beta)}(1, 0; 1, 0) = 0$ ;
- (c)  $I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_{i-1}, 0, p_{i+1}, \dots, p_n; q_1, \dots, q_{i-1}, 0, q_{i+1}, \dots, q_n) = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_{i-1}, p_{i+1}, \dots, p_n; q_1, \dots, q_{i-1}, q_{i+1}, \dots, q_n)$ ,  
for every  $i = 1, 2, \dots, n$ ;
- (d)  $I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_{i-1}, v_{i_1}, v_{i_2}, p_{i+1}, \dots, p_n; q_1, \dots, q_{i-1}, w_{i_1}, w_{i_2}, q_{i+1}, \dots, q_n) = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_{i-1}, p_i, p_{i+1}, \dots, p_n; q_1, \dots, q_{i-1}, q_i, q_{i+1}, \dots, q_n) +$   
 $+ \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} p_i^\alpha q_i^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)}\left(\frac{v_{i_1}}{p_i}, \frac{v_{i_2}}{p_i}; \frac{w_{i_1}}{q_i}, \frac{w_{i_2}}{q_i}\right) +$   
 $+ \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} p_i^\gamma q_i^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)}\left(\frac{v_{i_1}}{p_i}, \frac{v_{i_2}}{p_i}; \frac{w_{i_1}}{q_i}, \frac{w_{i_2}}{q_i}\right),$

for every  $v_{i_1} + v_{i_2} = p_i > 0$ ,  $w_{i_1} + w_{i_2} = q_i > 0$ ,  $i = 1, 2, \dots, n$  and  $A_{\alpha,\beta} = (2^{\alpha-\beta} - 1)$  and  $A_{\gamma,\delta} = (2^{\gamma-\delta} - 1)$ .

**Theorem 2.1.** Axioms (a)–(d) determine a measure given by

$$(2.4) \quad I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_n; q_1, \dots, q_n) = (A_{\alpha,\beta} - A_{\gamma,\delta})^{-1} \sum_{i=1}^n (p_i^\alpha q_i^{\beta-\alpha} - p_i^\gamma q_i^{\delta-\gamma}),$$

$$A_{\alpha,\beta} \neq A_{\gamma,\delta}, \quad \alpha, \gamma > 0,$$

where\*)  $A_{\alpha,\beta} = (2^{\alpha-\beta} - 1)$  and  $A_{\gamma,\delta} = (2^{\gamma-\delta} - 1)$ .

The proof of the above theorem is based on the following lemmas:

**Lemma 1.** If  $v_k \geq 0$ ,  $k = 1, 2, \dots, m$ ,  $\sum_{k=1}^m v_k = p_i > 0$ ,  $w_k > 0$ ,  $k = 1, 2, \dots, m$ ,  $\sum_{k=1}^m w_k = q_i > 0$ , then

$$(2.5) \quad I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_{i-1}, v_1, \dots, v_m, p_{i+1}, \dots, p_n; q_1, \dots, q_{i-1}, w_1, \dots, w_m, q_{i+1}, \dots, q_n) = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_n; q_1, \dots, q_n) +$$

\*). Throughout this paper, we shall adopt the notation  $A_{\alpha,\beta}$  for  $(2^{\alpha-\beta} - 1)$  and  $A_{\gamma,\delta}$  for  $(2^{\gamma-\delta} - 1)$ .

$$+ \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} p_i^\alpha q_i^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)} \left( \frac{v_1}{p_i}, \dots, \frac{v_m}{p_i}; \frac{w_1}{q_i}, \dots, \frac{w_m}{q_i} \right) + \\ + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} p_i^\gamma q_i^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)} \left( \frac{v_1}{p_i}, \dots, \frac{v_m}{p_i}; \frac{w_1}{q_i}, \dots, \frac{w_m}{q_i} \right).$$

**Proof.** We prove the lemma by induction. For  $m = 2$  the result holds (cf. axiom (d)). Let us suppose that the result is true for  $m = t$ . We have (under the notation  $\bar{V} = v_2 + \dots + v_{t+1}$ ,  $\bar{W} = w_2 + \dots + w_{t+1}$ ,  $v_1 + \bar{V} = p_i > 0$ ,  $w_1 + \bar{W} = q_i > 0$ )

$$(2.6) \quad \begin{aligned} & I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_{i-1}, v_1, \dots, v_{t+1}, p_{i+1}, \dots, p_n; q_1, \dots, q_{i-1}, \\ & \quad w_1, \dots, w_{t+1}, q_{i+1}, \dots, q_n) = \\ & = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_{i-1}, v_1, \bar{V}, p_{i+1}, \dots, p_n; q_1, \dots, q_{i-1}, w_1, \bar{W}, q_{i+1}, \dots, q_n) + \\ & \quad + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} \bar{V}^\alpha \bar{W}^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)} \left( \frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}} \right) + \\ & \quad + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} \bar{V}^\gamma \bar{W}^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)} \left( \frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}} \right) = \\ & = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_n; q_1, \dots, q_n) + \\ & \quad + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} p_i^\alpha q_i^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)} \left( \frac{v_1}{p_i}, \frac{\bar{V}}{p_i}; \frac{w_1}{q_i}, \frac{\bar{W}}{q_i} \right) + \\ & \quad + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} p_i^\gamma q_i^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)} \left( \frac{v_1}{p_i}, \frac{\bar{V}}{p_i}; \frac{w_1}{q_i}, \frac{\bar{W}}{q_i} \right) + \\ & \quad + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} \bar{V}^\alpha \bar{W}^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)} \left( \frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}} \right) + \\ & \quad + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} \bar{V}^\gamma \bar{W}^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)} \left( \frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}} \right) = \\ & = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_n; q_1, \dots, q_n) + \\ & \quad + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} p_i^\alpha q_i^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)} \left( \frac{v_1}{p_i}, \frac{\bar{V}}{p_i}; \frac{w_1}{q_i}, \frac{\bar{W}}{q_i} \right) + \\ & \quad + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} \bar{V}^\alpha \bar{W}^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)} \left( \frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}} \right) + \\ & \quad + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} p_i^\gamma q_i^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)} \left( \frac{v_1}{p_i}, \frac{\bar{V}}{p_i}; \frac{w_1}{q_i}, \frac{\bar{W}}{q_i} \right) + \\ & \quad + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} \bar{V}^\gamma \bar{W}^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)} \left( \frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}} \right). \end{aligned}$$

$$\begin{aligned}
(2.7) \quad & I_{(\gamma,\delta)}^{(\alpha,\beta)}\left(\frac{v_1}{p_i}, \dots, \frac{v_{t+1}}{p_i}; \frac{w_1}{q_i}, \dots, \frac{w_{t+1}}{q_i}\right) = \\
& = I_{(\gamma,\delta)}^{(\alpha,\beta)}\left(\frac{v_1}{p_i}, \frac{\bar{V}}{p_i}; \frac{w_1}{q_i}, \frac{\bar{W}}{q_i}\right) + \\
& + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} \left(\frac{\bar{V}}{p_i}\right)^{\alpha} \left(\frac{\bar{W}}{q_i}\right)^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)}\left(\frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}}\right) + \\
& + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} \left(\frac{\bar{V}}{p_i}\right)^{\gamma} \left(\frac{\bar{W}}{q_i}\right)^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)}\left(\frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}}\right).
\end{aligned}$$

For  $\gamma = \delta = 1$  (2.7) gives

$$\begin{aligned}
(2.8) \quad & I_{(1,1)}^{(\alpha,\beta)}\left(\frac{v_1}{p_i}, \dots, \frac{v_{t+1}}{p_i}; \frac{w_1}{q_i}, \dots, \frac{w_{t+1}}{q_i}\right) = I_{(1,1)}^{(\alpha,\beta)}\left(\frac{v_1}{p_i}, \frac{\bar{V}}{p_i}; \frac{w_1}{q_i}, \frac{\bar{W}}{q_i}\right) + \\
& + \left(\frac{\bar{V}}{p_i}\right)^{\alpha} \left(\frac{\bar{W}}{q_i}\right)^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)}\left(\frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}}\right).
\end{aligned}$$

For  $\alpha = \beta = 1$  (2.7) gives

$$\begin{aligned}
(2.9) \quad & I_{(\gamma,\delta)}^{(1,1)}\left(\frac{v_1}{p_i}, \dots, \frac{v_{t+1}}{p_i}; \frac{w_1}{q_i}, \dots, \frac{w_{t+1}}{q_i}\right) = I_{(\gamma,\delta)}^{(1,1)}\left(\frac{v_1}{p_i}, \frac{\bar{V}}{p_i}; \frac{w_1}{q_i}, \frac{\bar{W}}{q_i}\right) + \\
& + \left(\frac{\bar{V}}{p_i}\right)^{\gamma} \left(\frac{\bar{W}}{q_i}\right)^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)}\left(\frac{v_2}{\bar{V}}, \dots, \frac{v_{t+1}}{\bar{V}}; \frac{w_2}{\bar{W}}, \dots, \frac{w_{t+1}}{\bar{W}}\right).
\end{aligned}$$

Expression (2.6) together with (2.8) and (2.9) gives the desired result.

**Lemma 2.** If  $v_{ij} \geq 0, j = 1, 2, \dots, m_i; \sum_{j=1}^{m_i} v_{ij} = p_i > 0, i = 1, 2, \dots, n, \sum_{i=1}^n p_i = 1;$   
 $w_{ij} > 0, j = 1, 2, \dots, m_i, \sum_{j=1}^{m_i} w_{ij} = q_i > 0, i = 1, 2, \dots, n, \sum_{i=1}^n q_i \leq 1$ , then

$$\begin{aligned}
(2.10) \quad & I_{(\gamma,\delta)}^{(\alpha,\beta)}(v_{11}, \dots, v_{1m_1}, \dots, v_{n1}, \dots, v_{nm_n}; w_{11}, \dots, w_{1m_1}, \dots, w_{n1}, \dots, w_{nm_n}) = \\
& = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_n; q_1, \dots, q_n) + \\
& + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} \sum_{i=1}^n p_i^\alpha q_i^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)}\left(\frac{v_{i1}}{p_i}, \dots, \frac{v_{im_i}}{p_i}; \frac{w_{i1}}{q_i}, \dots, \frac{w_{im_i}}{q_i}\right) + \\
& + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} \sum_{i=1}^n p_i^\gamma q_i^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)}\left(\frac{v_{i1}}{p_i}, \dots, \frac{v_{im_i}}{p_i}; \frac{w_{i1}}{q_i}, \dots, \frac{w_{im_i}}{q_i}\right).
\end{aligned}$$

The proof of this lemma directly follows from the Lemma 1.

**Lemma 3.** If  $F_{(\gamma,\delta)}^{(\alpha,\beta)}(m; r) = I_{(\gamma,\delta)}^{(\alpha,\beta)}(1/m, \dots, 1/m; 1/r, \dots, 1/r)$   $1 \leq m \leq r$ , then

$$(2.11) \quad F_{(\gamma,\delta)}^{(\alpha,\beta)}(m; r) = \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} F_{(1,1)}^{(\alpha,\beta)}(m; r) + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} F_{(\gamma,\delta)}^{(1,1)}(m; r),$$

where

$$(2.12) \quad F_{(1,1)}^{(\alpha,\beta)}(m; r) = A_{\alpha,\beta}^{-1}(m^{1-\gamma}r^{\alpha-\beta} - 1), \quad A_{\alpha,\beta} \neq 0$$

and

$$(2.13) \quad F_{(\gamma,\delta)}^{(1,1)}(m; r) = A_{\gamma,\delta}^{-1}(m^{1-\gamma}r^{\gamma-\delta} - 1), \quad A_{\gamma,\delta} \neq 0.$$

**Proof.** Replacing in Lemma 2  $m_i$  by  $m$ ,  $v_{ij} = 1/mn$ ,  $w_{ij} = 1/rs$ ,  $q_i = 1/s$ ,  $i = 1, \dots, n$ ,  $j = 1, \dots, m$  where  $m$ ,  $n$ ,  $r$  and  $s$  are positive integers such that  $1 \leq m \leq r$ ,  $1 \leq n \leq s$  we obtain

$$(2.14) \quad F_{(\gamma,\delta)}^{(\alpha,\beta)}(mn; rs) = F_{(\gamma,\delta)}^{(\alpha,\beta)}(n; s) + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} n^{1-\alpha}s^{\alpha-\beta} F_{(1,1)}^{(\alpha,\beta)}(m; r) + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} n^{1-\gamma}s^{\gamma-\delta} F_{(\gamma,\delta)}^{(1,1)}(m; r).$$

$$(2.15) \quad F_{(\gamma,\delta)}^{(\alpha,\beta)}(mn; rs) = F_{(\gamma,\delta)}^{(\alpha,\beta)}(m; r) + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} m^{1-\alpha}r^{\alpha-\beta} F_{(1,1)}^{(\alpha,\beta)}(n; s) + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} m^{1-\gamma}r^{\gamma-\delta} F_{(\gamma,\delta)}^{(1,1)}(n; s).$$

Putting  $n = s = 1$  in (2.14) and using  $F_{(\gamma,\delta)}^{(\alpha,\beta)}(1; 1) = 0$  (for all  $\alpha, \beta, \gamma, \delta > 0$ ) we get

$$F_{(\gamma,\delta)}^{(\alpha,\beta)}(m; r) = \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} F_{(1,1)}^{(\alpha,\beta)}(m; r) + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} F_{(\gamma,\delta)}^{(1,1)}(m; r)$$

which is (2.11)

Equating (2.14) and (2.15) we get

$$(2.16) \quad \begin{aligned} F_{(\gamma,\delta)}^{(\alpha,\beta)}(n; s) &+ \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} n^{1-\alpha}s^{\alpha-\beta} F_{(1,1)}^{(\alpha,\beta)}(m; r) + \\ &+ \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} n^{1-\gamma}s^{\gamma-\delta} F_{(\gamma,\delta)}^{(1,1)}(m; r) = \\ &= F_{(\gamma,\delta)}^{(\alpha,\beta)}(m; r) + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} m^{1-\alpha}r^{\alpha-\beta} F_{(1,1)}^{(\alpha,\beta)}(n; s) + \\ &+ \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} m^{1-\gamma}r^{\gamma-\delta} F_{(\gamma,\delta)}^{(1,1)}(n; s). \end{aligned}$$

210 Expression (2.16) together with (2.11) gives

$$(2.17) \quad A_{\alpha,\beta}[(1 - m^{1-\alpha}r^{\alpha-\beta}) F_{(1,1)}^{(\alpha,\beta)}(n; s) + (n^{1-\alpha}s^{\alpha-\beta} - 1) F_{(1,1)}^{(\alpha,\beta)}(m; r)] = \\ = A_{\gamma,\delta}[(1 - m^{1-\gamma}r^{\gamma-\delta}) F_{(\gamma,\delta)}^{(1,1)}(n; s) + (n^{1-\gamma}s^{\gamma-\delta} - 1) F_{(\gamma,\delta)}^{(1,1)}(m; r)].$$

Putting  $n = 1, s = 2$  in (2.17) and using

$$F_{(\gamma,\delta)}^{(\alpha,\beta)}(1; 2) = I_{(\gamma,\delta)}^{(\alpha,\beta)}(1, 0; \frac{1}{2}, \frac{1}{2}) = 1 \quad \text{for all } \alpha, \beta, \gamma, \delta > 0$$

we get

$$A_{\alpha,\beta}[(1 - m^{1-\alpha}r^{\alpha-\beta}) + (2^{\alpha-\beta} - 1) F_{(1,1)}^{(\alpha,\beta)}(m; r)] = \\ = A_{\gamma,\delta}[(1 - m^{1-\gamma}r^{\gamma-\delta}) + (2^{\gamma-\delta} - 1) F_{(\gamma,\delta)}^{(1,1)}(m; r)] = C \quad (\text{say}).$$

For  $m = 1, r = 1$  we get  $C = 0$ . Thus we have

$$F_{(1,1)}^{(\alpha,\beta)}(m; r) = A_{\alpha,\beta}^{-1}(m^{1-\alpha}r^{\alpha-\beta} - 1), \quad A_{\alpha,\beta} \neq 0$$

and

$$F_{(\gamma,\delta)}^{(1,1)}(m; r) = A_{\gamma,\delta}^{-1}(m^{1-\gamma}r^{\gamma-\delta} - 1), \quad A_{\gamma,\delta} \neq 0$$

which are (2.12) and (2.13) respectively. This completes the proof of the lemma.

Now (2.11) together with (2.12) gives

$$(2.18) \quad F_{(\gamma,\delta)}^{(\alpha,\beta)}(m; r) = (A_{\alpha,\beta} - A_{\gamma,\delta})^{-1} (m^{1-\alpha}r^{\alpha-\beta} - m^{1-\gamma}r^{\gamma-\delta}).$$

**Proof of the Theorem.** We prove the theorem for rational values of  $p$ 's and  $q$ 's and then the continuity axiom (a) extends the result for all real values. Therefore let  $m, a_i$  and  $b_i$  be positive integers such that  $a_i \leq b_i$  for every  $i = 1, 2, \dots, n$  and if we put  $p_i = a_i/m, q_i = b_i/r, i = 1, 2, \dots, n$  where  $\sum_{i=1}^n a_i = m, \sum_{i=1}^n b_i \leq r$ , then the application of the Lemma 2 gives

$$I_{(\gamma,\delta)}^{(\alpha,\beta)}\left(\underbrace{\frac{1}{m}, \dots, \frac{1}{m}}_{a_1}, \dots, \underbrace{\frac{1}{m}, \dots, \frac{1}{m}}_{a_n}; \underbrace{\frac{1}{r}, \dots, \frac{1}{r}}_{b_1}, \dots, \underbrace{\frac{1}{r}, \dots, \frac{1}{r}}_{b_n}\right) = \\ = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_n; q_1, \dots, q_n) + \\ + \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} \sum_{i=1}^n P_i^\alpha q_i^{\beta-\alpha} I_{(1,1)}^{(\alpha,\beta)}\left(\frac{1}{a_i}, \dots, \frac{1}{a_i}; \frac{1}{b_i}, \dots, \frac{1}{b_i}\right) + \\ + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} \sum_{i=1}^n P_i^\gamma q_i^{\delta-\gamma} I_{(\gamma,\delta)}^{(1,1)}\left(\frac{1}{a_i}, \dots, \frac{1}{a_i}; \frac{1}{b_i}, \dots, \frac{1}{b_i}\right)$$

or

$$F_{(\gamma,\delta)}^{(\alpha,\beta)}(m; r) = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_n; q_1, \dots, q_n) +$$

$$+ \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} \sum_{i=1}^n p_i^\alpha q_i^{\beta-\alpha} F_{(1,1)}^{(\alpha,\beta)}(a_i; b_i) + \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} \sum_{i=1}^n p_i^\gamma q_i^{\delta-\gamma} F_{(\gamma,\delta)}^{(1,1)}(a_i; b_i)$$

i.e.

$$(2.19) \quad I_{(\gamma,\delta)}^{(\alpha,\beta)}(p_1, \dots, p_n; q_1, \dots, q_n) = \\ F_{(\gamma,\delta)}^{(\alpha,\beta)}(m, r) - \frac{A_{\alpha,\beta}}{A_{\alpha,\beta} - A_{\gamma,\delta}} \sum_{i=1}^n p_i^\alpha q_i^{\beta-\alpha} F_{(1,1)}^{(\alpha,\beta)}(a_i; b_i) - \\ - \frac{A_{\gamma,\delta}}{A_{\gamma,\delta} - A_{\alpha,\beta}} \sum_{i=1}^n p_i^\gamma q_i^{\delta-\gamma} F_{(\gamma,\delta)}^{(1,1)}(a_i; b_i).$$

Expression (2.19) together with (2.12), (2.13) and (2.18) gives (2.4).

### 3. BIVARIATE DISTRIBUTIONS

Let  $X = (x_1, \dots, x_n)$  and  $Y = (y_1, \dots, y_m)$  be two discrete random variables. The information-theoretic measure of type  $\binom{\alpha, \beta}{\gamma, \delta}$  for two probability distributions  $P(X)$  and  $Q(X)$  of  $X$  is given by

$$(3.1) \quad I_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X); Q(X)) = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p(x_1), \dots, p(x_n); q(x_1), \dots, q(x_n)) = \\ = (A_{\alpha,\beta} - A_{\gamma,\delta})^{-1} \sum_{i=1}^n (p^\alpha(x_i) q^{\beta-\alpha}(x_i) - p^\gamma(x_i) q^{\delta-\gamma}(x_i)),$$

where  $p(x_i) = P(X = x_i)$ ,  $q(x_i) = Q(X = x_i)$ ,  $i = 1, 2, \dots, n$  and  $\sum_{i=1}^n p(x_i) = \sum_{i=1}^n q(x_i) = 1$ .

An analogous formula holds for the random variable  $Y$ .

Next if  $p(x_i, y_j) = P(X = x_i, Y = y_j)$  and  $q(x_i, y_j) = Q(X = x_i, Y = y_j)$  are the joint probabilities of  $(x_i, y_j)$  then the joint information-theoretic measure of type  $\binom{\alpha, \beta}{\gamma, \delta}$  is given by

$$(3.2) \quad I_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X, Y); Q(X, Y)) = \\ = I_{(\gamma,\delta)}^{(\alpha,\beta)}(p(x_1, y_1), \dots, p(x_1, y_m), \dots, p(x_n, y_1), \dots, p(x_n, y_m); \\ q(x_1, y_1), \dots, q(x_1, y_m), \dots, q(x_n, y_1), \dots, q(x_n, y_m)) = \\ = (A_{\alpha,\beta} - A_{\gamma,\delta})^{-1} \sum_{i=1}^n \sum_{j=1}^m (p^\alpha(x_i, y_j) q^{\beta-\alpha}(x_i, y_j) - p^\gamma(x_i, y_j) q^{\delta-\gamma}(x_i, y_j)),$$

where  $\sum_{i=1}^n \sum_{j=1}^m p(x_i, y_j) = \sum_{i=1}^n \sum_{j=1}^m q(x_i, y_j) = 1$ .

212

Further  $P(Y/x_i) = \{p(y_1/x_i), \dots, p(y_m/x_i)\}$  and  $Q(Y/x_i) = \{q(y_1/x_i), \dots, q(y_m/x_i)\}$  are complete distributions of  $Y$  given  $X = x_i$ , therefore the conditional information-theoretic measure of type  $\binom{\alpha, \beta}{\gamma, \delta}$  of  $Y$  given  $X$  may be defined as follows:

$$(3.3) \quad \begin{aligned} I_{(\gamma, \delta)}^{(\alpha, \beta)}(P(Y/X); Q(Y/X)) &= \\ &= \frac{A_{\alpha, \beta}}{A_{\alpha, \beta} - A_{\gamma, \delta}} \sum_{i=1}^n p^x(x_i) q^{\beta-\alpha}(x_i) I_{(1, 1)}^{(\alpha, \beta)}(P(Y/x_i); Q(Y/x_i)) + \\ &+ \frac{A_{\gamma, \delta}}{A_{\gamma, \delta} - A_{\alpha, \beta}} \sum_{i=1}^n p^y(x_i) q^{\delta-\gamma}(x_i) I_{(\gamma, \delta)}^{(1, 1)}(P(Y/x_i); Q(Y/x_i)), \end{aligned}$$

where

$$(3.4) \quad I_{(1, 1)}^{(\alpha, \beta)}(P(Y/x_i); Q(Y/x_i)) = A_{\alpha, \beta}^{-1} \left[ \sum_{j=1}^m p^x(y_j/x_i) q^{\beta-\alpha}(y_j/x_i) - 1 \right]$$

and

$$(3.5) \quad I_{(\gamma, \delta)}^{(1, 1)}(P(Y/x_i); Q(Y/x_i)) = A_{\gamma, \delta}^{-1} \left[ \sum_{j=1}^m p^y(y_j/x_i) q^{\delta-\gamma}(y_j/x_i) - 1 \right],$$

$i = 1, 2, \dots, n$ .

Similarly we can obtain the information-theoretic measure of type  $\binom{\alpha, \beta}{\gamma, \delta}$  of  $X$  given  $Y$ .

The interdependence and relationships among these bivariate measures are studied in the following theorems:

**Theorem 3.1.** If  $X$  and  $Y$  are two discrete random variables then

$$(3.6) \quad \begin{aligned} I_{(\gamma, \delta)}^{(\alpha, \beta)}(P(X, Y); Q(X, Y)) &= I_{(\gamma, \delta)}^{(\alpha, \beta)}(P(X); Q(X)) + I_{(\gamma, \delta)}^{(\alpha, \beta)}(P(Y/X); Q(Y/X)) = \\ &= I_{(\gamma, \delta)}^{(\alpha, \beta)}(P(Y); Q(Y)) + I_{(\gamma, \delta)}^{(\alpha, \beta)}(P(X/Y); Q(X/Y)), \end{aligned}$$

where  $p(x_i, y_j) = p(x_i) p(y_j/x_i) = p(y_j) p(x_i/y_j)$ ,  $i = 1, 2, \dots, n$ ,  $j = 1, 2, \dots, m$ .

**Proof.** From the definitions given above we have

$$\begin{aligned} I_{(\gamma, \delta)}^{(\alpha, \beta)}(P(X); Q(X)) + I_{(\gamma, \delta)}^{(\alpha, \beta)}(P(Y/X); Q(Y/X)) &= \\ &= (A_{\alpha, \beta} - A_{\gamma, \delta})^{-1} \sum_{i=1}^n (p^x(x_i) q^{\beta-\alpha}(x_i) - p^y(x_i) q^{\delta-\gamma}(x_i)) + \\ &+ (A_{\alpha, \beta} - A_{\gamma, \delta})^{-1} \sum_{i=1}^n p^x(x_i) q^{\beta-\alpha}(x_i) \left[ \sum_{j=1}^m p^x(y_j/x_i) q^{\beta-\alpha}(y_j/x_i) - 1 \right] + \\ &+ (A_{\gamma, \delta} - A_{\alpha, \beta})^{-1} \sum_{i=1}^n p^y(x_i) q^{\delta-\gamma}(x_i) \left[ \sum_{j=1}^m p^y(y_j/x_i) q^{\delta-\gamma}(y_j/x_i) - 1 \right] = \end{aligned}$$

$$\begin{aligned}
&= (A_{\alpha,\beta} - A_{\gamma,\delta})^{-1} \sum_{i=1}^n \sum_{j=1}^m [p^\alpha(x_i) p^\alpha(y_j/x_i) q^{\beta-\alpha}(x_i) q^{\beta-\alpha}(y_j/x_i) - \\
&\quad - p^\gamma(x_i) p^\gamma(y_j/x_i) q^{\delta-\gamma}(x_i) q^{\delta-\gamma}(y_j/x_i)] = \\
&= (A_{\alpha,\beta} - A_{\gamma,\delta})^{-1} \sum_{i=1}^n \sum_{j=1}^m [p^\alpha(x_i, y_j) q^{\beta-\alpha}(x_i, y_j) - p^\gamma(x_i, y_j) q^{\delta-\gamma}(x_i, y_j)] = \\
&= I_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X, Y); Q(X, Y)).
\end{aligned}$$

**Theorem 3.2.** If  $X$  and  $Y$  are statistically independent discrete random variables then

(a)

$$\begin{aligned}
(3.7) \quad I_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X, Y); Q(X, Y)) &= G_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X); Q(X)) I_{(\gamma,\delta)}^{(\alpha,\beta)}(P(Y); Q(Y)) + \\
&\quad + G_{(\gamma,\delta)}^{(\alpha,\beta)}(P(Y); Q(Y)) I_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X); Q(X)),
\end{aligned}$$

where

$$(3.8) \quad G_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X); Q(X)) = \frac{1}{2} \sum_{i=1}^n (p^\alpha(x_i) q^{\beta-\alpha}(x_i) + p^\gamma(x_i) q^{\delta-\gamma}(x_i)),$$

(b)

$$(3.9) \quad I_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X, Y); Q(X, Y)) \leq I_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X); Q(X)) + I_{(\gamma,\delta)}^{(\alpha,\beta)}(P(Y); Q(Y)),$$

for all  $\alpha, \gamma \geq 1, \beta - \alpha \geq 1$  and  $\delta - \gamma \geq 1$ .

**Proof.** The proof of the part (a) follows by simple computation.

(b) For  $\alpha, \gamma \geq 1, \beta - \alpha \geq 1$  and  $\delta - \gamma \geq 1$  we have from (3.8)

$$(3.10) \quad G_{(\gamma,\delta)}^{(\alpha,\beta)}(P(X); Q(X)) \leq 1.$$

Expression (3.7) together with (3.10) gives (3.9).

#### ACKNOWLEDGEMENT

Authors are thankful to Dr. B. D. Sharma, Department of Mathematics, University of Delhi for guidance in the preparation of this paper and for discussions at various stages.
